

Sound Amplification 2009
First Transdimensional Bank+Church
Population: 14

Our sound amplification system is modest, and designed to provide music at a relaxing volume level for the inside of our 20' geodesic dome – a public shade structure. It is comprised of a small audio mixer (for plugging in iPods and laptops) and two full range powered speakers similar to a Mackie SRM 450. These speakers will not be used to anything near their full volume, and our music will not be heard in adjacent camps (it has not been heard outside our camp in the past). There is no reason to consider placing us in one of the high-volume areas as our puny sound powers would be squashed like a small terrestrial insect in an elephant stampede.
